

Step-by-Step Simulation example

Example 1 decimal comma version

Background information

This presentation describes step-by-step how a basic RTGS simulation is performed using the BoF-PSS2 simulator.

The main steps are

- Input data creation
- Simulation execution
- Analysis of results

This version uses decimal comma as decimal delimiter and semicolon as data delimiter, which is important to note in order to get the Excel interface to function properly.

(If you are using decimal points please change to the other version of the example).

How to follow the example

Instructions in this example are mainly presented with screenshots from simulator. These will tell you what the simulator window looks like, when you have finished the necessary actions in that simulator window. Instructions for steps in one window can however be divided into several slides.

Therefore follow the steps of the example by repeating **only** the actions which are pointed with  thick arrows (from top to down)

Thin arrows are used occasionally in explanations and require no action. 

Start the simulator

Double click on the simulator icon or start the program from the windows program menu.

Three windows will open up:

- Start-up window for simulator
- MySQL window for database interface
- Simulator user interface window

All three windows are necessary during simulations and will be closed automatically when you exit from the simulator.

Initial start up

5

First time you run the simulator initial specifications open up.

Specify a project name. Projects are used to separate simulation topics

Click on one of the fields and the default database and directory names emerge. (Stick to the defaults if no particular reason to change.)

Save project

Go to main menu

Initial specifications

Bank of Finland Payment and Settlement Simulator

Version: 0.9.6/2004-02-24
Licensee: Bank of Finland
Financial Markets

Initial specifications

☒ Create new project: ☐ Modify old project:

Databases

The simulator will create a new input and output database for each project in the indicated default directory. The user can change directory and also specify an already existing input and output database when desired. However, there can only be one input and output database assigned to the same project at one time.

Input database:

Output database:

Default directories

The simulator will use indicated default directories for the different file types. Each project is assumed to have its own default directories. The user can change the defaults and also use common directories.

Default directory for input files:

Default directory for error list:

Default directory for output files:

Default directory for output reports:

Bank of Finland Payment and Settlement Simulator

Main menu

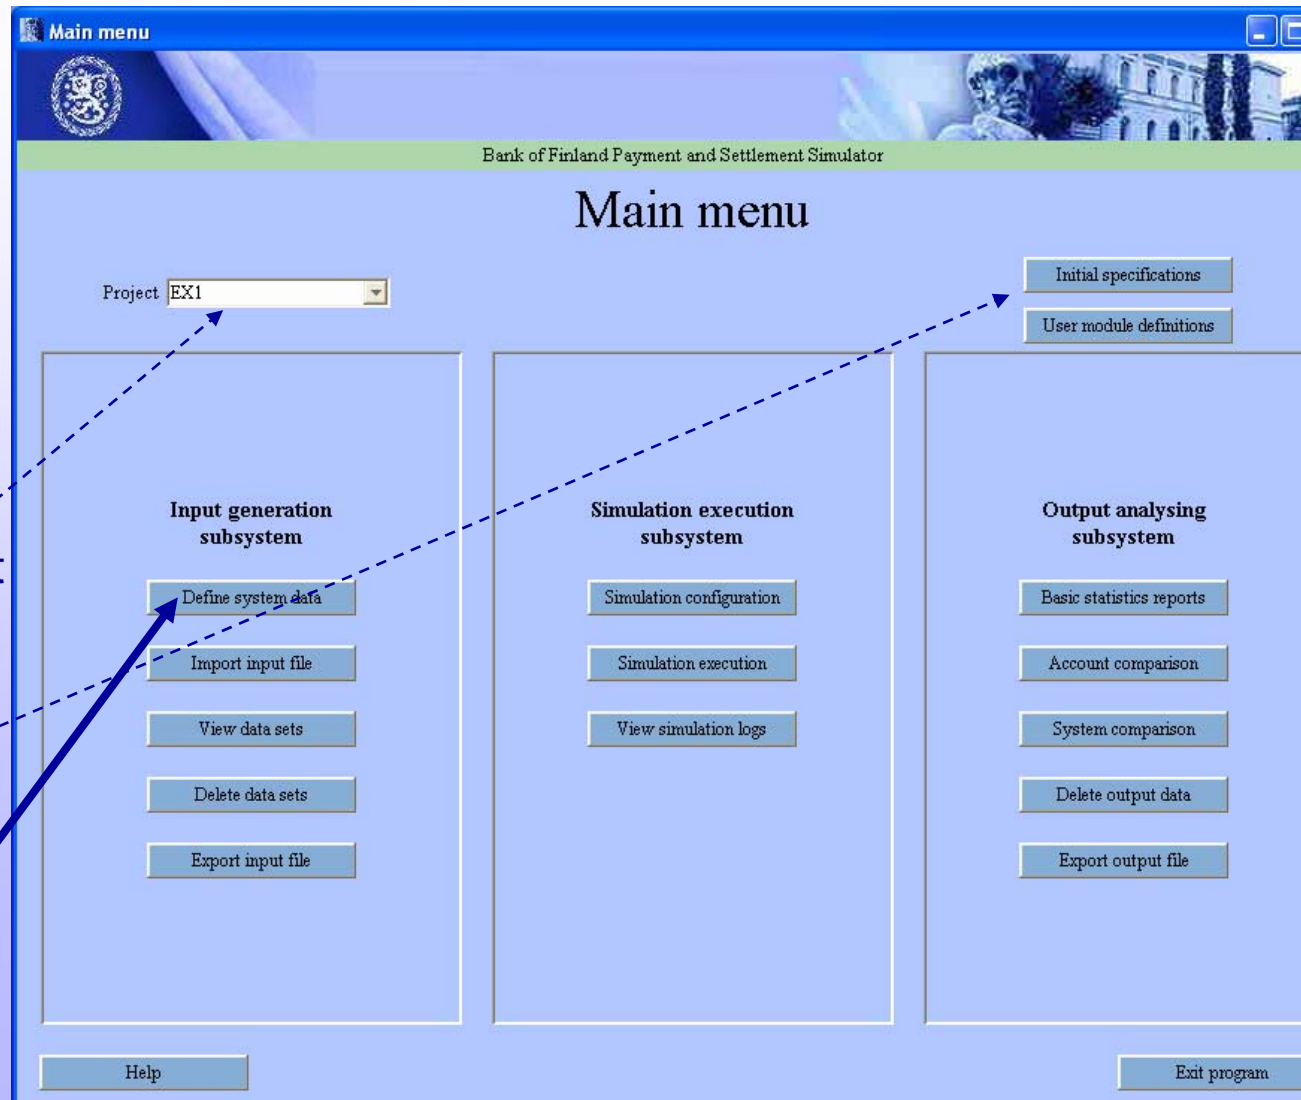

The main menu will open up whenever you start the simulator in the future.

It provides the window to the different functions of the simulator.

You can choose the project you are working with

and define new projects when necessary (see previous slide)

Start by defining system data
(click on the button).

System data definition 1

7

In system definition

Type the system ID
EX1_RTGS again
precisely in the same
form as it was used
when importing data.
(case sensitive)

And give name
(FreeCred) for this
system data set.
(see next slide)

Bank of Finland Payment and Settlement Simulator

System control data specification/modification

Project: EX1

Select existing system ID Create new system ID

Modify old system data set Create new system data set Copy from old system data set

System full name: Opens (minimum 24h): System description:

System type: Closes:

System account:

Transfer of balances

☐ Transfer balances to next day

☐ Bilateral limit in use

Intraday credit availability

☒ Credits according to limit table, or

☐ No credits available, or

☐ Credit available without limits

Handling of unsettled transactions

☒ Transfer unsettled transactions to next day/settlement occasion or

☐ Delete unsettled transactions or

☐ Force end-of-day settlement of unsettled transactions

Potential algorithms: select one and add it to the attached algorithms by pressing the 'Add algorithm' button. ENT and END algorithms are mandatory.

Add algorithm

Attached algorithms: Changes of order by dragging/dropping. Deletion by striking keyboard 'delete' button for active algorithms.

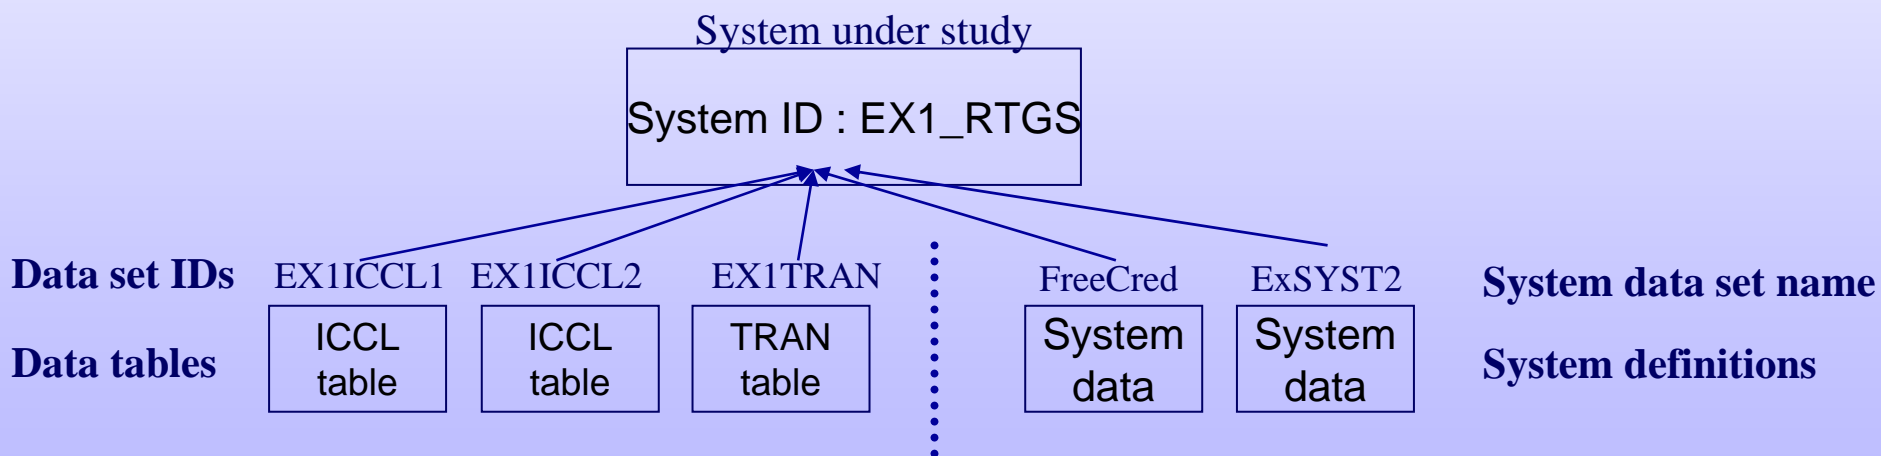

Algorithm	Algorithm type	Double click row to insert parameter values

Help Save system data set Back to main menu Exit program

System ID & system data set name

System ID is the name for the “real” system under study. It is used to link together all different datasets belonging to one system.

Dataset ID:s were used to allow storage of parallel data tables. Similarly system definitions are given a system dataset name to allow parallel system setups. These can easily be used to test i.e. different queuing methods or effects of including some optimization feature.

System ID:s are needed because there can be several “real” systems in one project or one simulation e.g. parallel RTGS and DNS-systems.

System data definition 2

9

System full name and description are optional (use these for notes)

-Choose system type (RTGS)

System types available:

- RTGS (real time gross settlement),
- CNS (continuous net settlement) and
- DNS (deferred net settlement)

-Set the opening hours. (in this example 0700 – 1900)

Define system data

☐ Bilateral limit in use

Intraday credit availability

☒ Credits according to limit table, or

☐ No credits available, or

☐ Credit available without limits

Handling of unsettled transactions

☒ Transfer unsettled transactions to next day/settlement occasion or

☐ Delete unsettled transactions or

☐ Force end-of-day settlement of unsettled transactions

Potential algorithms: select one and add it to the attached algorithms by pressing the 'Add algorithm' button. ENT and END algorithms are mandatory.

Attached algorithms: Changes of order by dragging/dropping. Deletion by striking keyboard 'delete' button for active algorithms.

Algorithm	Algorithm type	Double click row to insert parameter values

System data definition 3

10

-Choose (in this example) *credit available without limits* in to allow free intraday credit.

Intraday credit-settings always affect all participants and accounts in one simulated system

-Transferring of balances and options for handling unsettled transactions at the end on day can be defined. These are currently irrelevant since EX1 data has only one day

QUFIFOPR	QUE

Double click row to insert parameter values

- **Algorithms are used to define the processing conventions for each system. There are several algorithm types (with three letter names e.g. QUE) and often more than one actual algorithm within each type to choose from (e.g. QUFIFOPR and QUBYPAFI).**
- **One simulated system can not include two algorithms of same type.**
- **Three types are mandatory (SUB, ENT & END) others are optional**

Types can be classified in main- and sub-algorithms (see next 2 slides)

Main algorithms

- **SUB** (submission) algorithm determines when a transaction is submitted for processing, i.e. chooses next transaction to be processed. SUB algorithm is **not** selected in the system definition.
- **ENT** (entry) algorithm is first processing phase for a transaction. Transactions are generally transferred to bookings when liquidity is available or queued/discarded if there is a lack of liquidity.
- **SET** (settlement) algorithm processes queued transactions, e.g. invoking gridlock- resolution algorithms. Is needed always if there is a queue in system structure
- **END** (end-of-day) algorithm clears up end-of-day situations

These can be invoked by ENT, SET and END algorithms

- **QUE** (queue release) algorithms release transactions from waiting queues in a defined order
- **SPL** (splitting) algorithms split large transactions into small, easy-to-process transactions
- **INJ** (injection) algorithms transfer liquidity from/to accounts to/from other systems
- **BOS** (bilateral offsetting) nets queued transactions between two counterparties in a given order
- **PNS** (partial net settlement) algorithms seek multilateral payment batches that can be netted
- **MNS** (complete multilateral settlement) netting of all transactions in queues

Precise definitions for algorithms can be found in simulator manuals

Main menu

15

When system definition
is successfully done,
return to main menu...

and proceed with
importing data

The screenshot shows the 'Main menu' window of the 'Bank of Finland Payment and Settlement Simulator'. The window has a blue title bar and a green header bar with the text 'Bank of Finland Payment and Settlement Simulator'. Below the header, the title 'Main menu' is centered. On the left, there is a 'Project' dropdown menu currently set to 'EX1'. The main area is divided into three vertical panels. The left panel, titled 'Input generation subsystem', contains five buttons: 'Define system data', 'Import input file', 'View data sets', 'Delete data sets', and 'Export input file'. The middle panel, titled 'Simulation execution subsystem', contains three buttons: 'Simulation configuration', 'Simulation execution', and 'View simulation logs'. The right panel, titled 'Output analysing subsystem', contains five buttons: 'Basic statistics reports', 'Account comparison', 'System comparison', 'Delete output data', and 'Export output file'. At the bottom left is a 'Help' button, and at the bottom right is an 'Exit program' button. The background of the window features a faint image of a classical building and a statue.

Bank of Finland Payment and Settlement Simulator

There are four types of input files

- Participant data files
- Transaction data files
- Intraday credit data files
- Beginning-of-day balances files

All input files are comma-separate-value files (CSV-files). See next slide.

The default folder for input files is INPUT in the corresponding project directory. In our project EX1 –case it is C:/BoF-PSS2/P_EX1/INPUT

↓ Please copy the input files Ex1-part.csv and Ex1-tran.csv from the directory c:/BoF-PSS2/EXAMPLES/DECIMAL_COMMA to the example default input directory C:/BoF-PSS2/P_EX1/INPUT. Example material can also be found on the web pages of the simulator. See www.bof.fi/sc/bof-pss

The “import input file” screen can now be used to import the data to input database of the simulator.

Import participant data 1

17

Select PART table

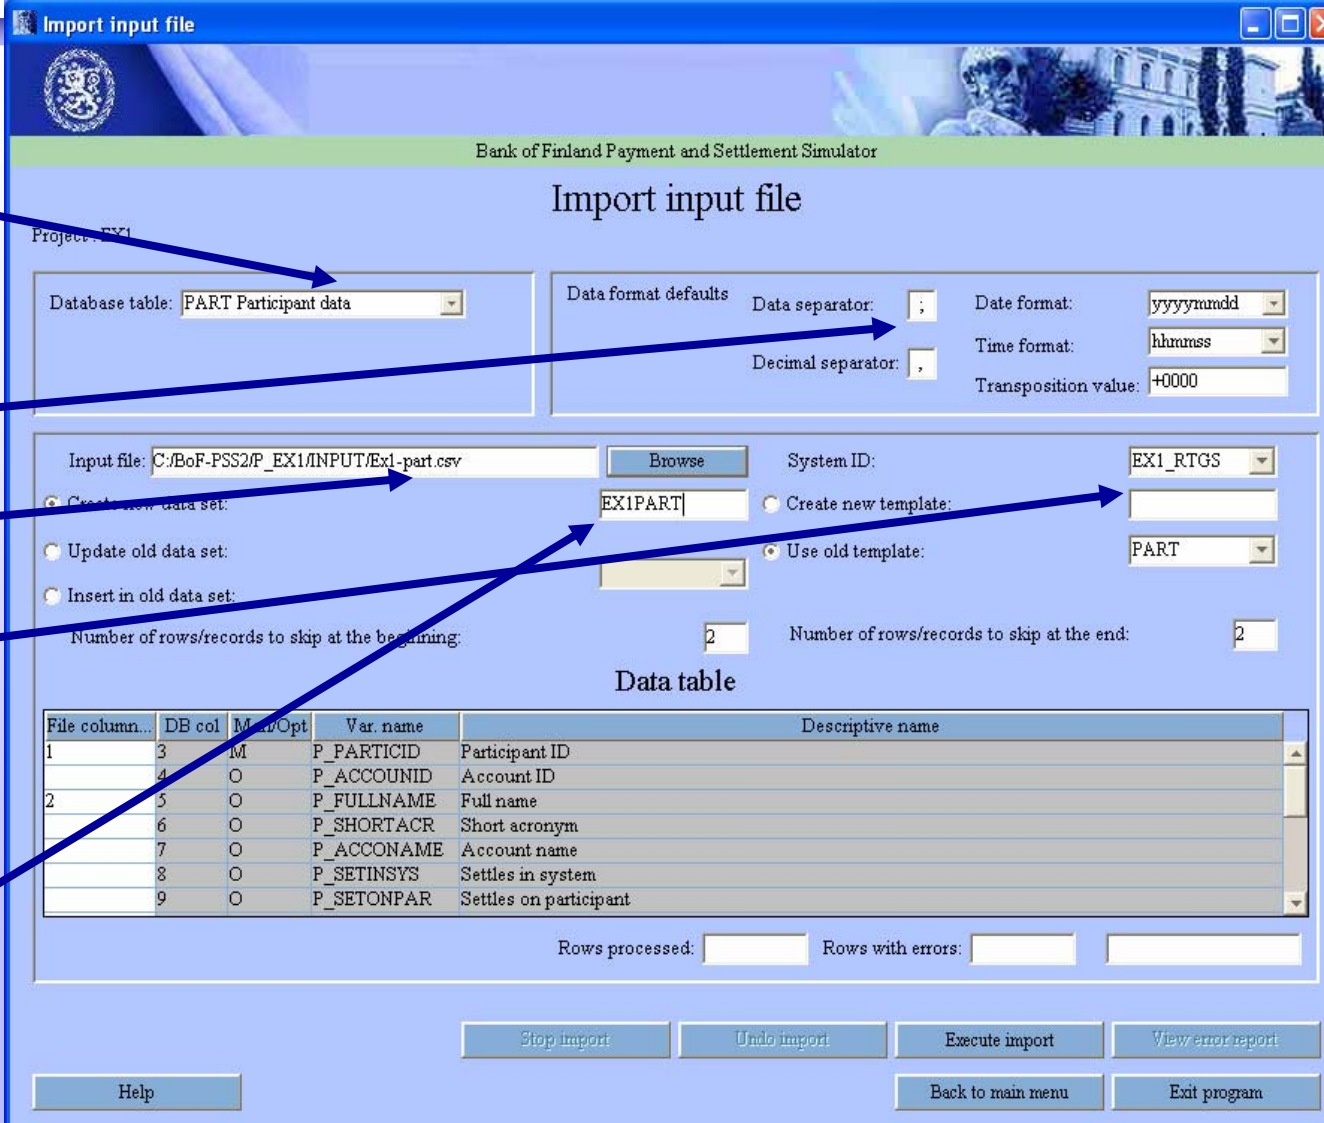

Check that data and decimal separator are correct (; and ,)

Browse for input file

Select system ID from the drop down list (in this example EX1_RTGS)

State data set ID, (i.e. EX1PART)

See explanation on next page

Bank of Finland Payment and Settlement Simulator

Import input file

Project: EX1

Database table: **PART Participant data**

Data format defaults

Data separator: ; Date format: yyyyymmdd

Decimal separator: , Time format: hhmmss

Transposition value: +0000

Input file: C:\BoF-PSS2\P_EX1\INPUT\Ex1-part.csv Browse

System ID: **EX1_RTGS**

Create new data set: **EX1PART** Create new template:

Update old data set: Use old template: **PART**

Insert in old data set:

Number of rows/records to skip at the beginning: 2 Number of rows/records to skip at the end: 2

Data table

File column...	DB col	MapOpt	Var. name	Descriptive name
1	3	M	P_PARTICID	Participant ID
	4	O	P_ACCOUNTID	Account ID
2	5	O	P_FULLNAME	Full name
	6	O	P_SHORTACR	Short acronym
	7	O	P_ACCONAME	Account name
	8	O	P_SETINSYS	Settles in system
	9	O	P_SETONPAR	Settles on participant

Rows processed: Rows with errors:

Stop import Undo import Execute import View error report

Help Back to main menu Exit program

Data sets

- Data set IDs allow storage of parallel data tables in database
- Simulations may use different data sets for varying the input data, e.g. more or less intraday credit, normal or exceptional transaction flows

Data set IDs	CRVAL1	CRVAL2		CRVALn
Data tables	ICCL table	ICCL table	...	ICCL table

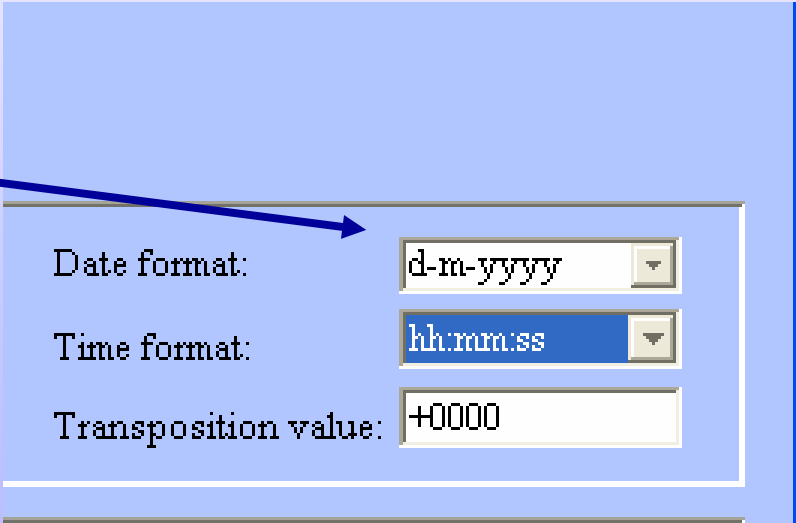

*Use a clear naming convention
for different data sets*

Import participant data 1

Next check that date and time format match with the csv-file in question.
(see the next slide)

In this example they should be as follows:

A screenshot of a configuration window with a light blue background. It contains three rows of settings. The first row is 'Date format:' with a dropdown menu showing 'd-m-yyyy'. The second row is 'Time format:' with a dropdown menu showing 'hh:mm:ss'. The third row is 'Transposition value:' with a text input field containing '+0000'. A blue arrow points from the text 'In this example they should be as follows:' to the 'Date format:' dropdown.

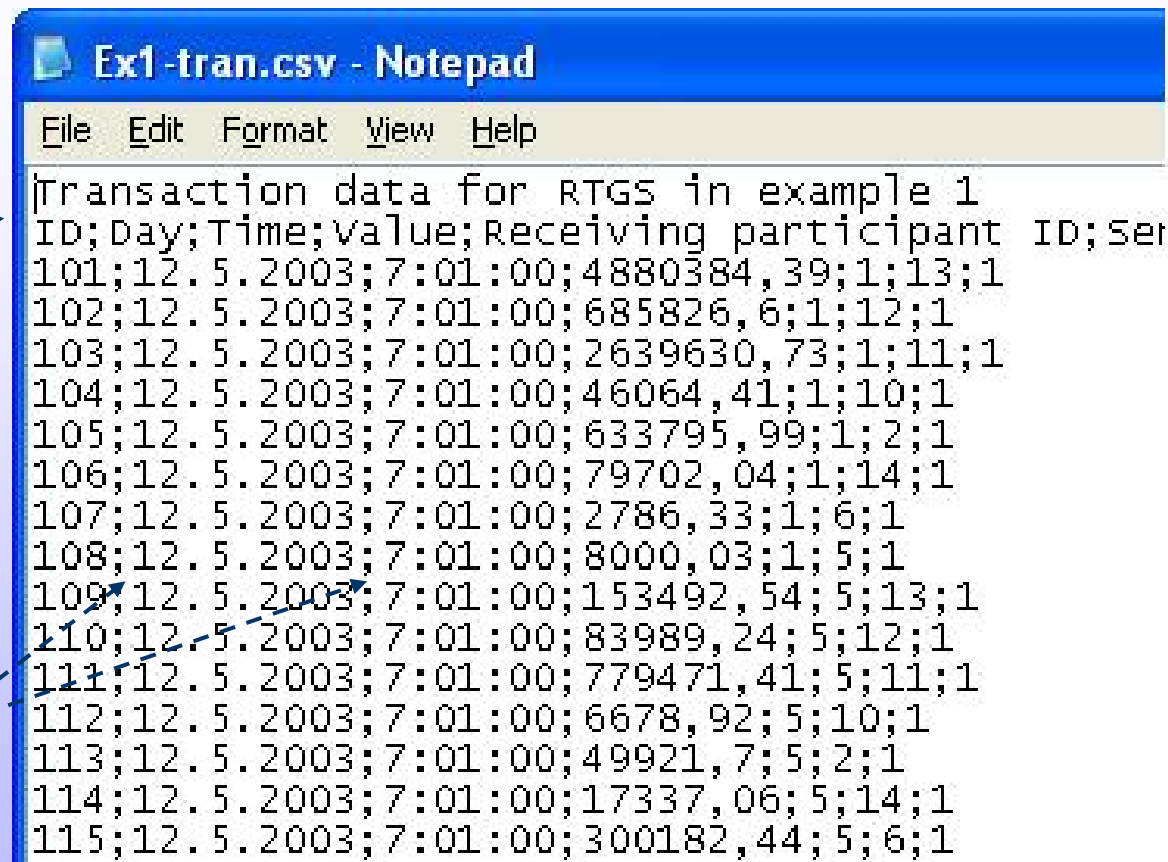

Date format:	d-m-yyyy
Time format:	hh:mm:ss
Transposition value:	+0000

Typical CSV-file

Title lines are helpful for labelling data fields and data set. They can be skipped in import

Data delimiter between each data field (;)

Clic “Ok” in popup
Informing the ending
of import

Check that all lines
were imported
Successfully
(0 lines with error)

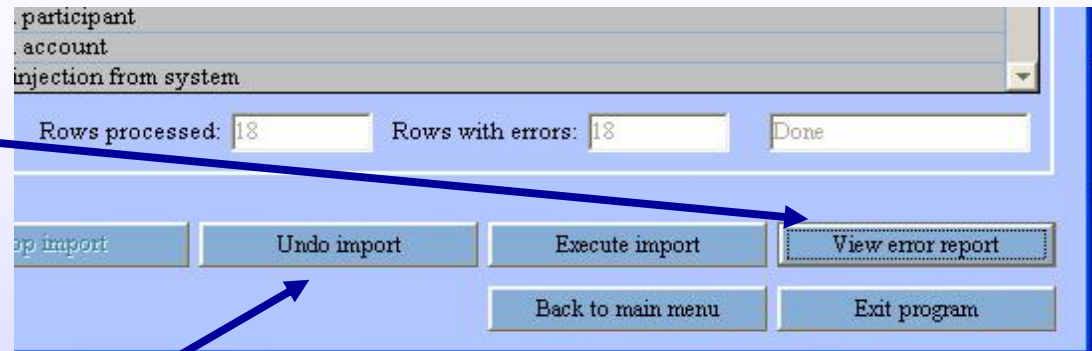

If there were errors
see the next two
slides

If the import wasn't
Successful you
can view error report.
See the next slide.

(It opens in Excel, which
needs to be closed in order
to get back to the simulator)

And undo the import.

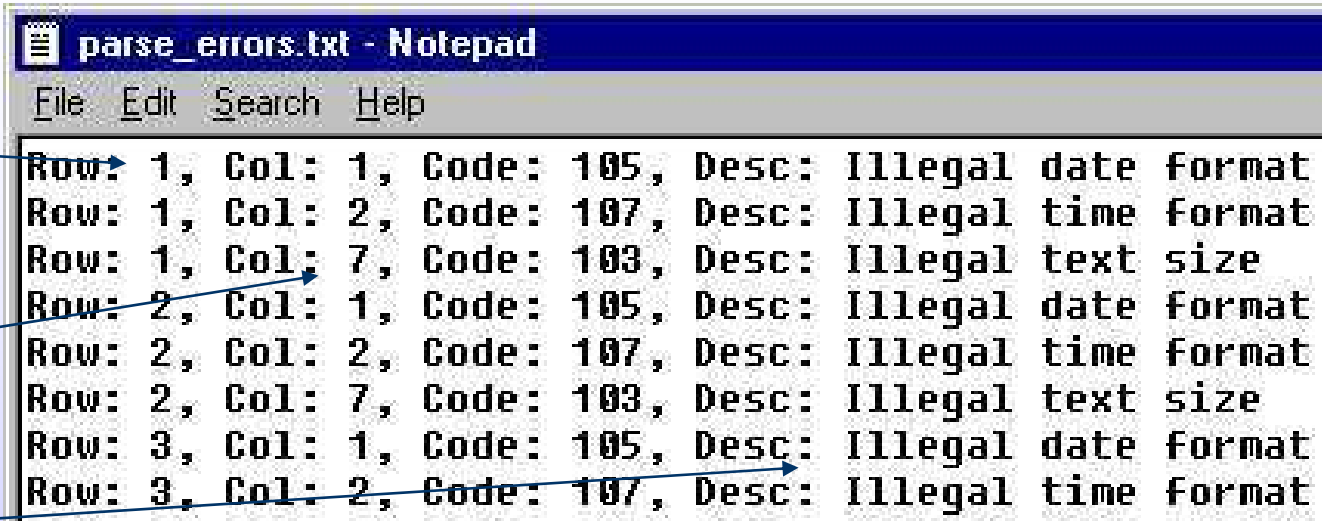

For opening the error reports outside the simulator look in
to ERRORLIST folder in the projects directory (in this
example C:\BoF-PSS2\P_EX1\ERRORLIST)

Line in CSV-file
with error

Column/field
with error

Error type

Row: 1, Col: 1, Code: 105, Desc: Illegal date format
Row: 1, Col: 2, Code: 107, Desc: Illegal time format
Row: 1, Col: 7, Code: 103, Desc: Illegal text size
Row: 2, Col: 1, Code: 105, Desc: Illegal date format
Row: 2, Col: 2, Code: 107, Desc: Illegal time format
Row: 2, Col: 7, Code: 103, Desc: Illegal text size
Row: 3, Col: 1, Code: 105, Desc: Illegal date format
Row: 3, Col: 2, Code: 107, Desc: Illegal time format

Some possible problems now:

- Incorrect data or decimal separator (look at the slide “Import participant data 1”)
- Incorrect number of lines to skip in the beginning of csv-file (same as above)

Common problems with real data (not present in these examples):

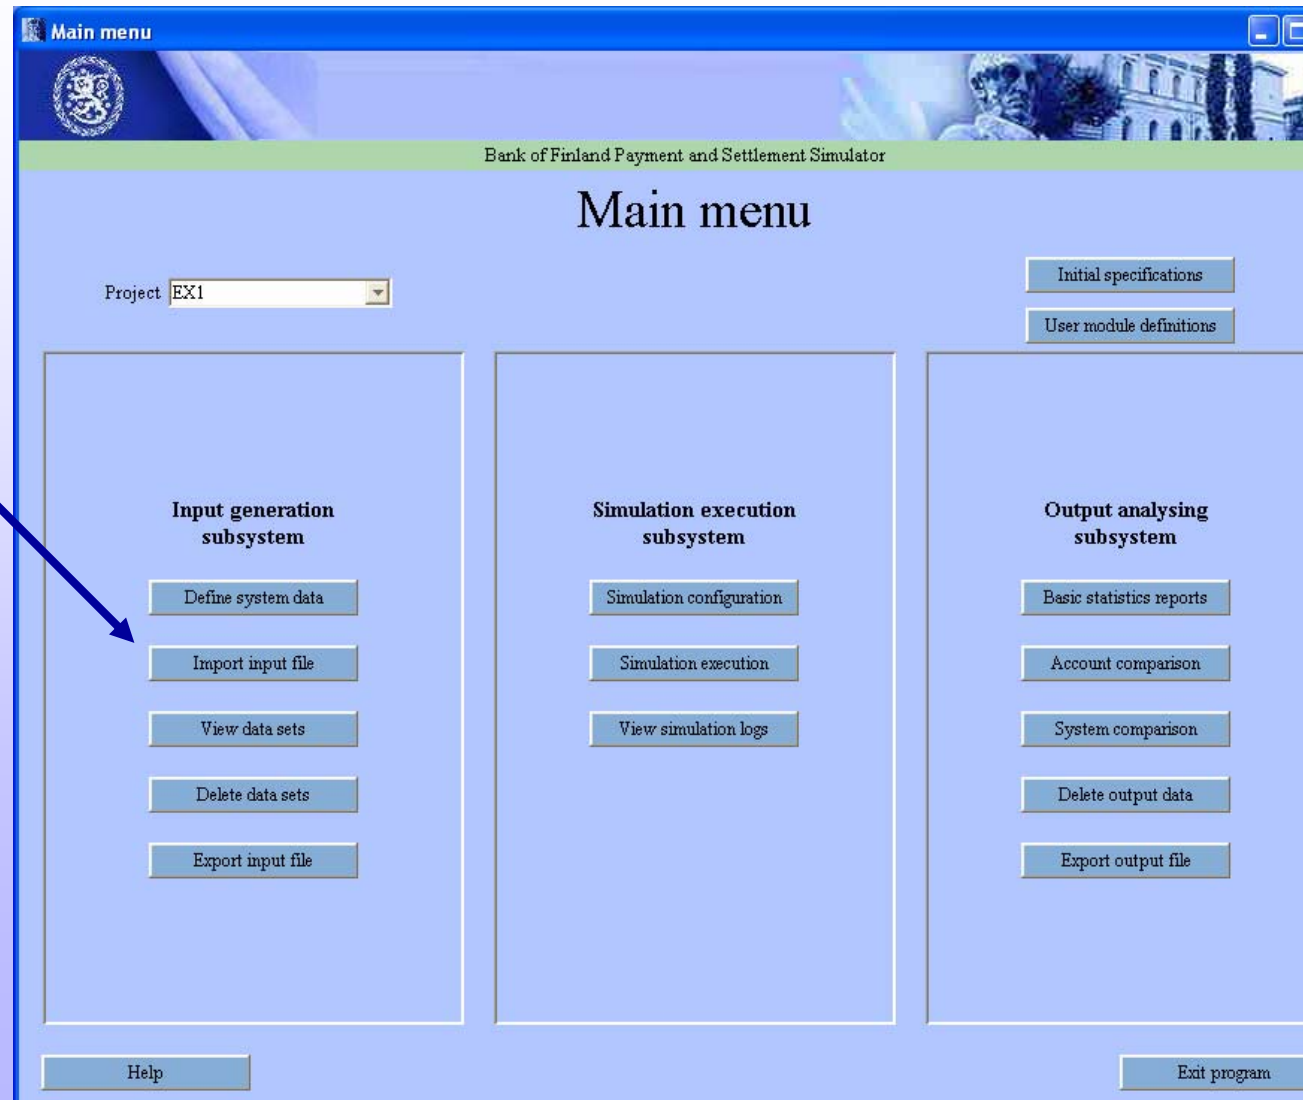

- The csv-file can contain empty rows (usually) at the end of the file
Open the csv-file in notepad to check if there are rows like ,,,, at the end of file.
- Or the data in cvs-file just isn't looking like what was expected, check the template and data file (use notepad again)

Help Back to main menu Exit program

Bank of Finland Payment and Settlement Simulator

Import transaction data 3

29

When import is finished check that it was successful (0 rows with errors)

If there were errors you can view the error report and undo the import.

The screenshot shows a software interface for importing transaction data. At the top, there is a list of data types: 'participant', 'account', and 'injection from system'. Below this, there are two input fields: 'Rows processed:' with the value '18' and 'Rows with errors:' with the value '18'. To the right of these fields is a 'Done' button. Below the input fields, there are several buttons: 'Import' (partially visible), 'Undo import', 'Execute import', 'View error report' (highlighted with a red dashed border), 'Back to main menu', and 'Exit program'. A blue arrow points from the text 'If there were errors you can view the error report and undo the import.' to the 'View error report' button.

Basic solutions to error situations were listed on slide “Import error handling for participant data”. New things to check here are for instance:

- **Date and time format in simulator. Dash (-) in date format and colon (:) in time format can represent any separator mark in date or time data of csv file.**
- **Check the template and data file again to see that the data is situated and presented as you expected (open the csv file in notepad)**

When repeating the import after making corrections choose “use old template”. Changes in template are saved automatically when the template is used.

Input generation subsystem

Define system data

Import input file

View data sets

Delete data sets

Export input file

Three last buttons in import subsystem can be used to handle already imported datasets.

← View data in input database (see next slide)

← Delete data from input database
(second next slide)

← Export data from the input database,
e.g. for editing purposes

View data set window is useful for checking moderate size data tables

View data sets

Bank of Finland Payment and Settlement Simulator

View data sets

deleted

Bank of Finland Payment and Settlement Simulator

Delete data sets

Project : EX1

Data type: System ID:

EXITRAN

To delete data sets, press Ctrl and click the data sets active with the left mouse button. Press the Delete data sets button below.

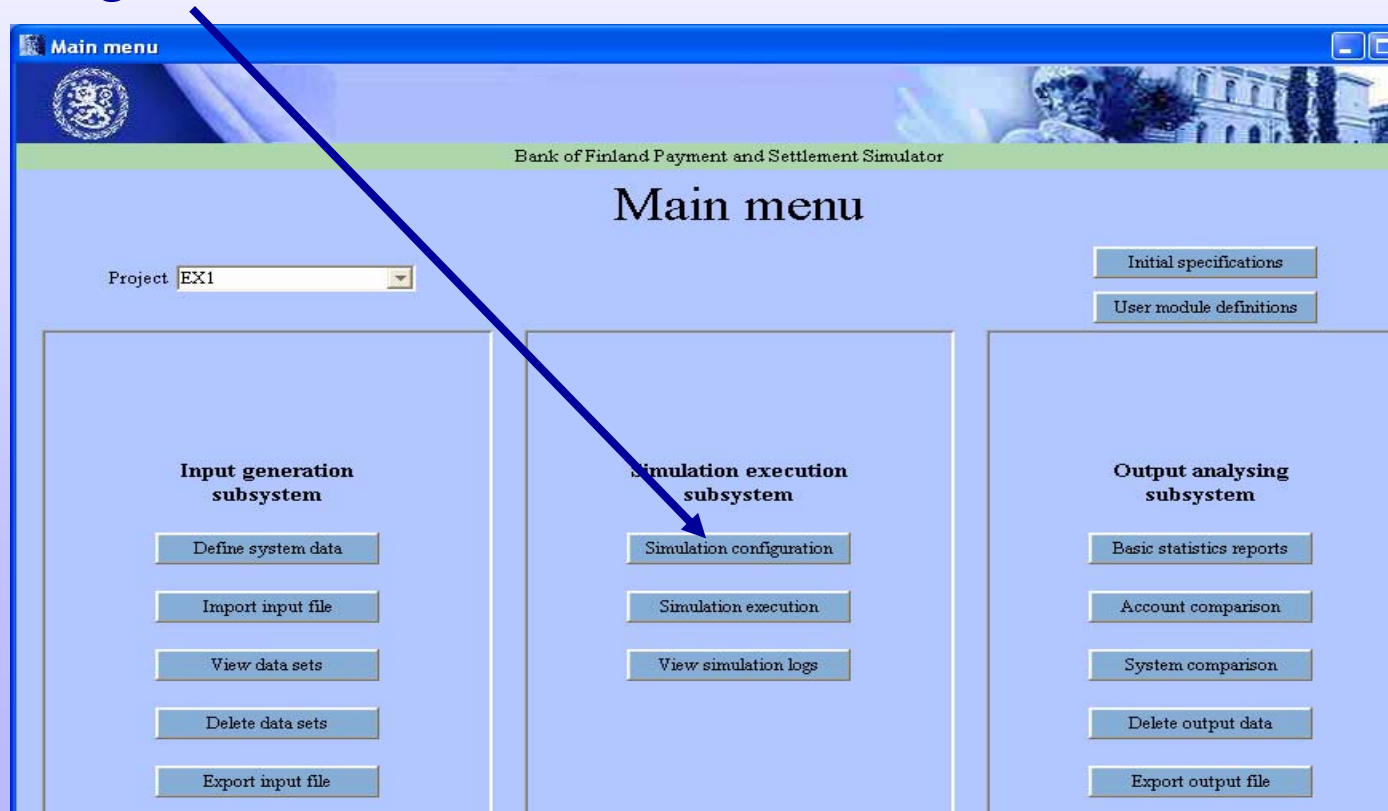

Help

Optimise input database Delete data sets

Back to main menu Exit program

Now the first main phase *input data creation* is cleared.

Move to simulation execution by selecting *simulation configuration* in main menu

Simulation configuration 1

34

In simulation configuration window simulations are built by selecting the desired combination of imported data sets.

Start by typing simulation ID
Simulation name and description are optional.

Again use good naming convention which describes the configured simulation.

Select which datasets are included in this simulation.

If you have several options available in System ID or you can't find some dataset you imported see the next slide.

Simulation configuration

Bank of Finland Payment and Settlement Simulator

Project : EX1

☐ Modify old simulation ID ☒ Create new simulation ID Copy from old simulation ID

Simulation name:

Description:

Sub-algorithm: Parameters

Data sets to simulation:

System ID	SYCD	TRAN	PART	ICCL	DBAL	BLIM
	<input type="text" value="EX1_R..."/>	<input type="text" value="FreeCred"/>	<input type="text" value="EX1TR..."/>	<input type="text" value="EX1PA..."/>	<input type="text"/>	<input type="text"/>

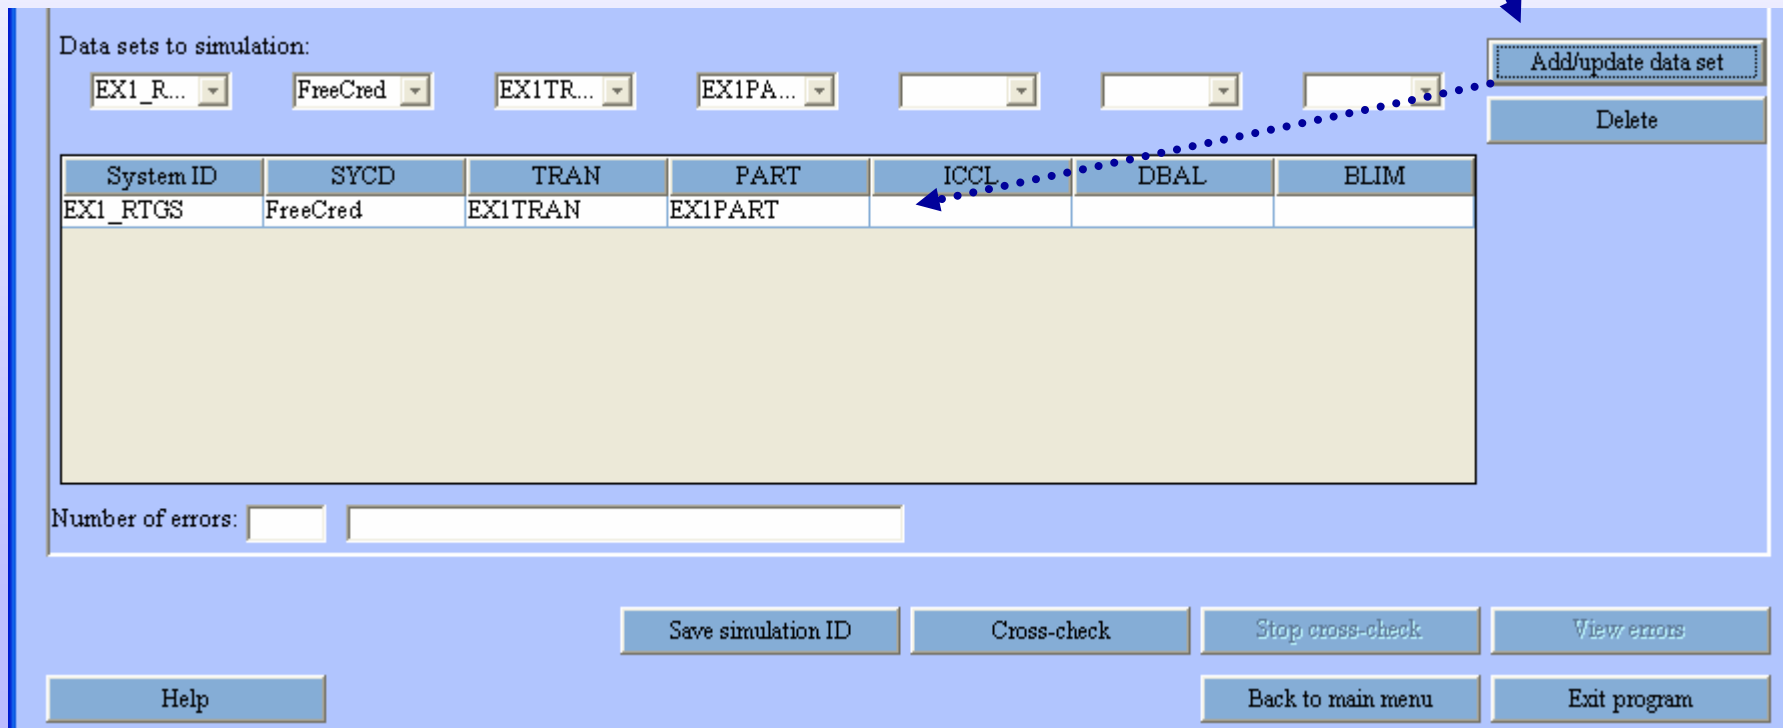

For defining data sets for the simulation first select the desired system ID in the corresponding drop-down box above the table, then the desired data sets. Next press the add/update data set button to move the new data to the data table. A system can be deleted from the table by selecting the system ID and pressing the Delete button.

Number of errors:

Simulation configuration 2

35

After selecting all necessary datasets from drop menus add them to simulation.

Data sets to simulation:

EX1_R... FreeCred EX1TR... EX1PA... [] [] []

System ID	SYCD	TRAN	PART	ICCL	DBAL	BLIM
EX1_RTGS	FreeCred	EX1TRAN	EX1PART			

Number of errors: [] []

Buttons: Add/update data set, Delete, Save simulation ID, Cross-check, Stop cross-check, View errors, Help, Back to main menu, Exit program

Simulation configuration 2

36

The integrity of configured simulation data must be checked.
This is done by executing Cross-check.

When cross-check is completed, make sure there were no errors.

(Otherwise see the next slide)

And save the created simulation ID

The screenshot displays the 'Simulation configuration 2' window. At the top, 'Sub-algorithm' is set to 'SUFIFOPR'. Below it, 'Data sets to simulation' includes 'EX1_R...', 'FreeCred', and 'EX1TR...'. A table lists simulation data with columns: System ID, SYCD, TRAN, AL, and BLIM. The first row contains 'EX1_RTGS', 'FreeCred', 'EXITRAN', 'EXIPART', and an empty cell. An 'Information' dialog box is open in the center, displaying 'cross check completed' with an 'OK' button. At the bottom, a 'Number of errors' field shows '0' and a 'Done' button. The bottom toolbar contains buttons for 'Save simulation ID', 'Cross-check', 'Stop cross-check', 'View errors', 'Help', 'Back to main menu', and 'Exit program'.

System ID	SYCD	TRAN	AL	BLIM
EX1_RTGS	FreeCred	EXITRAN	EXIPART	

Cross-checking for data coherency

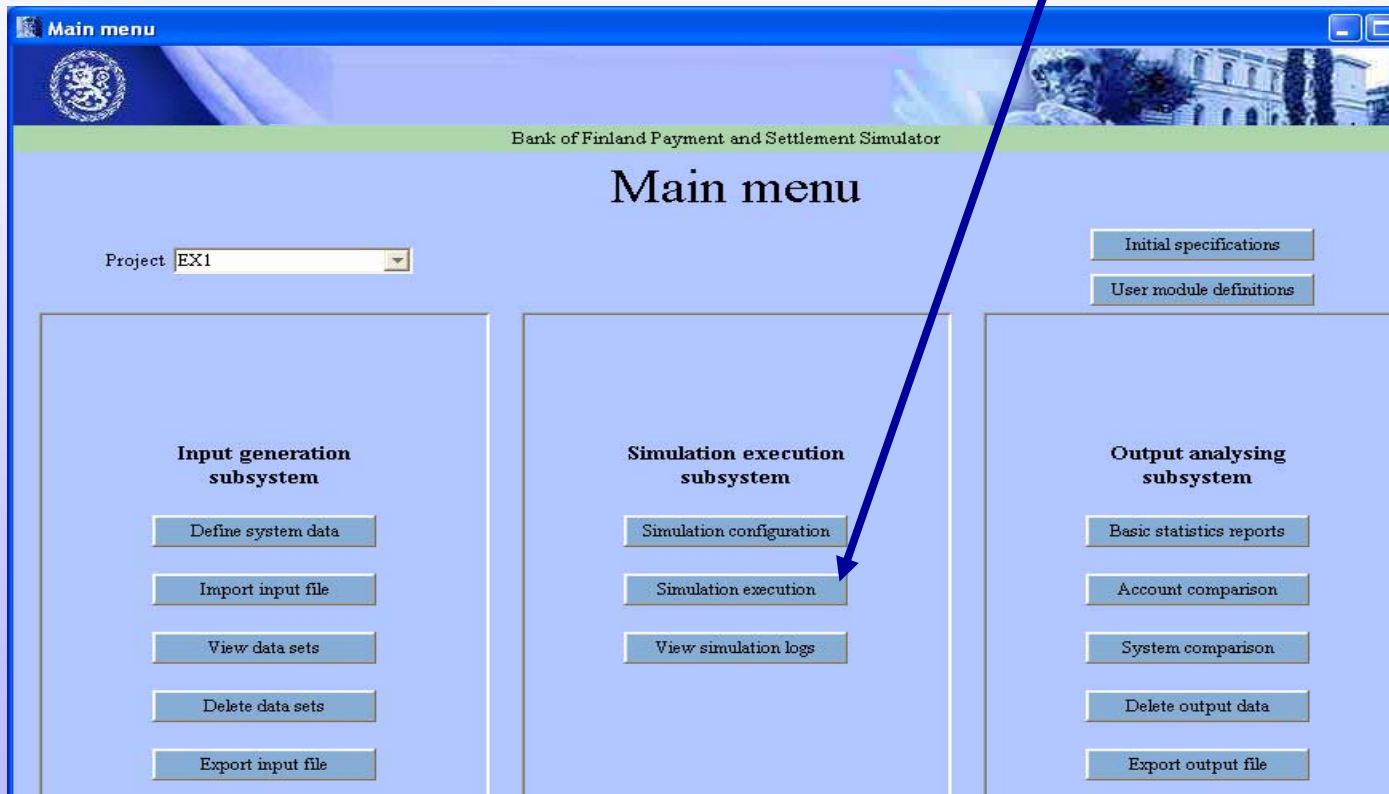

- Simulation configuration implies definition of which systems will run and with which data sets
- Cross-checking implies checking for data coherency e.g. that
 - all participants/accounts mentioned in transactions are available.
 - all systems are available as demanded by inter-system transactions
 - Systems are open when transactions are entering (same for intraday credit limit changes and beginning of day balances)
- Import functions have only checked the correctness of data values, but no cross-table checks have been made
- Incoherent data (sets) will not execute
- Cross-check will give error reports similar to import errors if there are problems

Simulation execution 1

38

Return to main menu and select simulation execution

Simulation execution 1

39

Batch run info can be saved for re-use (optional)

Select the simulation you want to execute and click Add simulation.

(Several simulations can be included in one batch run)

Define which output databases are saved (Basic set: SYLS, ACST & TEST)

Start the simulation

Simulation execution

Project : EX1

☐ Modify old simulation batch ID ☐ Create new simulation batch ID Copy from old simulation batch ID

Select a simulation ID and add it to the table by pressing the add simulation ID button. A simulation can be deleted from the batch by selecting the simulation ID and by pressing thereafter the Delete button.

Simulation ID Simulation name ☐ Execute cross-check ☐ Skip cross-check

Simulation id	Simulation name	System level stat.	Account stat.	Transact. event stat.	Netting event stat.	Account violation stat.	Booking event stat.	Unsettled transact. stat.	Submitted transact. stat.	Queued transact. stat.	Bilateral account stat.	Queue reason stat.
EIFREE	Ex1 with FREE cre...	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

writing output EIFREE 2003-05-12 TEST

The progress of simulation execution is shown as the current time in simulation or as the name of the output table written

Simulation execution 2

40

After simulation is successfully executed, return to main menu.

You will be asked about unsaved data. (batch run information) Select to exit anyway.

With Batch ID it is possible to save the created setup (which simulations to run and which output tables to save for each simulation) For this tiny example such is not worthwhile.

Simulation execution 3

41

Simulation execution subsystem

Simulation configuration

Simulation execution

View simulation logs

The third button in execution subsystem (*view simulation logs*) can be used to examine previous simulations and available output data tables

Help Back to main menu Exit program

Reports can be created after successful execution of a simulation

The output analysing subsystem provides basic output reports and export facilities

Output analysing subsystem

Basic statistics reports

Account comparison

System comparison

Delete output data

Export output file

Basic statistics report

Account level comparisons of simulations

System level comparisons of simulations

Deleting unnecessary output data

Exporting output files for further analyses
(all data from output database to CSV files)

Ready made reports: basic statistics

44

Simple reports can be exported (Output file name) from *Basic statistics reports* window after choosing the executed simulation

These include i.e. Simple system or account level statistics (see next slide) and time series with defined time interval

After choosing the desired report, you can save it or save & open with Excel (close excel to return to simulator)

Bank of Finland Payment and Settlement Simulator

Basic statistics reports

Project : EX1

All data fields and rows of a given data table recognised by the simulation ID can be exported

What next?

- You can run the same simulation with intraday credit limits. For this new data set(s) need to be imported. (see Ex1-description.txt)
- Having several simulations run in one project, you can test account & system comparison reports

There are also three other examples provided with different systems structures (correct answers are also included):

- **Example 2 with** two systems, a main RTGS and a continuous net settlement system in interaction.
- **Example 3 with** two systems, a main RTGS and a deferred net settlement system, in interaction.
- **Example 4 with** RTGS based securities settlement system with Delivery Versus Payment -functionality.
