ヘロト 人間 とくほとく ほとう

Introduction	Background ○	Data ○	Methodology ○○●○○	Results	Conclusions O	References			
How do v	How do we measure clustering?								

• The market clustering observation is defined as the number of shared securities, summed over all pairs of investors. For each pair of firms, we first establish if they both trade in the security. If this is the case, we count the number of securities which these two firms are also trading simultaneously.

$$M_{s,t} = \sum_{f}^{n_{F,t}} \sum_{f'>f}^{n_{F,t}} \left(a_{sf,t} a_{sf',t} \sum_{s'\neq s}^{n_{S,t}} a_{s'f,t} a_{s'f',t} \right).$$
